Problem 1

With the definition of z_n , rewrite the equation

$$\min_{A,B} F(A,B) = \frac{1}{N} \sum_{n=1}^{N} \ln \left(1 + \exp \left(-y_n \left(A z_n + B \right) \right) \right)$$
 (1)

So

$$\frac{\partial F}{\partial A} = \frac{1}{N} \sum_{n=1}^{N} -y_n \left(\frac{\exp(-y_n (Az_n + B))}{1 + \exp(-y_n (Az_n + B))} \right)^T z_n = \frac{1}{N} \sum_{n=1}^{N} -y_n p_n^T z_n$$
 (2)

$$\frac{\partial F}{\partial B} = \frac{1}{N} \sum_{n=1}^{N} -y_n \left(\frac{\exp(-y_n (Az_n + B))}{1 + \exp(-y_n (Az_n + B))} \right)^T = \frac{1}{N} \sum_{n=1}^{N} -y_n p_n^T$$
 (3)

Hence

$$\nabla F(A, B) = \frac{1}{N} \sum_{n=1}^{N} \left[-y_n z_n p_n, -y_n p_n \right]^T$$
 (4)

Use the result of Problem 1 and define $\exp(-y_n(Az_n+B)) = \exp(\xi_n)$, we have

$$\frac{\partial^2 F}{\partial A^2} = \frac{\partial}{\partial A} \left(\frac{1}{N} \sum_{n=1}^N -y_n p_n^T z_n \right) \tag{5}$$

$$= \frac{1}{N} \sum_{n=1}^{N} -y_n \left(\frac{-y_n \exp(\xi_n) (1 + \exp(\xi_n)) z_n - y_n (\exp(\xi_n))^2 z_n}{(1 + \exp(\xi_n))^2} \right) z_n$$
 (6)

$$= \frac{1}{N} \sum_{n=1}^{N} -y_n \left(\frac{-y_n \exp(\xi_n) z_n}{(1 + \exp(\xi_n))^2} \right) z_n$$
 (7)

$$= \frac{1}{N} \sum_{n=1}^{N} (y_n)^2 \left(\frac{\exp(\xi_n)}{1 + \exp(\xi_n)} \left(1 - \frac{\exp(\xi_n)}{1 + \exp(\xi_n)} \right) \right) z_n^2$$
 (8)

$$= \frac{1}{N} \sum_{n=1}^{N} z_n^2 p_n (1 - p_n) \tag{9}$$

where $y_n^2 = 1$ since $y_n \in \{-1, +1\}$.

The other term is

$$\frac{\partial^2 F}{\partial A \partial B} = \frac{\partial}{\partial A} \left(\frac{1}{N} \sum_{n=1}^N -y_n p_n^T \right) = \frac{1}{N} \sum_{n=1}^N -y_n \left(\frac{-y_n \exp(\xi_n) z_n}{\left(1 + \exp(\xi_n)\right)^2} \right)$$
(10)

$$= \frac{1}{N} \sum_{n=1}^{N} z_n p_n (1 - p_n) \tag{11}$$

$$\frac{\partial^2 F}{\partial B \partial A} = \frac{\partial}{\partial B} \left(\frac{1}{N} \sum_{n=1}^N -y_n p_n^T z_n \right) = \frac{1}{N} \sum_{n=1}^N -y_n \left(\frac{-y_n \exp(\xi_n)}{\left(1 + \exp(\xi_n)\right)^2} \right) z_n \tag{12}$$

$$= \frac{1}{N} \sum_{n=1}^{N} z_n p_n (1 - p_n) \tag{13}$$

$$\frac{\partial^2 F}{\partial B^2} = \frac{\partial}{\partial B} \left(\frac{1}{N} \sum_{n=1}^N -y_n p_n^T \right) = \frac{1}{N} \sum_{n=1}^N -y_n \left(\frac{-y_n \exp\left(\xi_n\right)}{\left(1 + \exp\left(\xi_n\right)\right)^2} \right)$$
(14)

$$=\frac{1}{N}\sum_{n=1}^{N}p_{n}\left(1-p_{n}\right)\tag{15}$$

Hence, we have

$$H(F) = \frac{1}{N} \sum_{n=1}^{N} \begin{bmatrix} z_n^2 p_n (1 - p_n) & z_n p_n (1 - p_n) \\ z_n p_n (1 - p_n) & p_n (1 - p_n) \end{bmatrix}$$
(16)

As $\gamma \to \infty$, we have

$$\lim_{\gamma \to \infty} \exp\left(-\gamma \|\mathbf{x}_n - \mathbf{x}_m\|^2\right) = 0 \tag{17}$$

So K should be a zero matrix with size $N \times N$, which is $\mathbf{0}_{N \times N}$.

And $\boldsymbol{\beta}$ is

$$\boldsymbol{\beta} = (\lambda I + K)^{-1} \mathbf{y} = \lambda^{-1} \mathbf{y}$$
(18)

Problem 4

If $|y_n - \mathbf{w}^T \phi(\mathbf{x}_n) - b| \ge \epsilon$, then

$$\begin{cases} |y_{n} - \mathbf{w}^{T} \phi(\mathbf{x}_{n}) - b| - \epsilon = \xi_{n}^{\wedge} \text{ and } \xi_{n}^{\vee} = 0, & \text{if } y_{n} - \mathbf{w}^{T} \phi(\mathbf{x}_{n}) - b > 0 \\ |y_{n} - \mathbf{w}^{T} \phi(\mathbf{x}_{n}) - b| - \epsilon = \xi_{n}^{\vee} \text{ and } \xi_{n}^{\wedge} = 0, & \text{if } y_{n} - \mathbf{w}^{T} \phi(\mathbf{x}_{n}) - b < 0 \end{cases}$$
(19)

and if $|y_n - \mathbf{w}^T \phi(\mathbf{x}_n) - b| < \epsilon$, then $\xi_n^{\wedge} = 0$ and $\xi_n^{\vee} = 0$. Hence, we have

$$\left(\xi_{n}^{\wedge}\right)^{2} + \left(\xi_{n}^{\vee}\right)^{2} = \left(\max\left(0, \left|y_{n} - \mathbf{w}^{T}\phi\left(\mathbf{x}_{n}\right) - b\right| - \epsilon\right)\right)^{2}$$
(20)

So P_2 is equivalent to

$$\min_{b,\mathbf{w}} \left(\frac{1}{2} \mathbf{w}^T \mathbf{w} + C \sum_{n=1}^{N} \left(\max \left(0, \left| y_n - \mathbf{w}^T \phi \left(\mathbf{x}_n \right) - b \right| - \epsilon \right) \right)^2 \right)$$
 (21)

with no constraints.

Problem 5

The first term is of course

$$\frac{\partial}{\partial \beta_m} \left(\frac{1}{2} \sum_{m=1}^{N} \sum_{n=1}^{N} \beta_n \beta_m K(\mathbf{x}_n, \mathbf{x}_m) \right) = \sum_{n=1}^{N} \beta_n K(\mathbf{x}_n, \mathbf{x}_m)$$
 (22)

With \mathbf{w}_* , rewrite the result of Problem 4,

something =
$$C \sum_{n=1}^{N} \left(\max \left(0, \left| y_n - \sum_{m=1}^{N} \beta_m K(\mathbf{x}_n, \mathbf{x}_m) - b \right| - \epsilon \right) \right)^2$$
 (23)

$$= C \sum_{n=1}^{N} (\max(0, |y_n - s_n| - \epsilon))^2$$
 (24)

Consider the following cases.

1. $|y_n - s_n| \ge \epsilon$.

Then we have

$$\frac{\partial}{\partial \beta_m} \left(\text{something} \right) = \frac{\partial}{\partial \beta_m} \left(C \left(|y_n - s_n| - \epsilon \right)^2 \right) \tag{25}$$

$$= (2C(|y_n - s_n| - \epsilon)) \frac{\partial}{\partial \beta_m} |y_n - s_n|$$
 (26)

$$= -2C(|y_n - s_n| - \epsilon)\operatorname{sign}(y_n - s_n)\frac{\partial s_n}{\partial \beta_m}$$
(27)

$$= -2C(|y_n - s_n| - \epsilon)\operatorname{sign}(y_n - s_n) K(\mathbf{x}_n, \mathbf{x}_m)$$
 (28)

 $2. |y_n - s_n| < \epsilon.$

Then we have

$$\frac{\partial}{\partial \beta_m} \text{ (something)} = 0 \tag{29}$$

So we have

$$\frac{\partial F(b, \boldsymbol{\beta})}{\partial \beta_m} = \sum_{n=1}^{N} \beta_n K(\mathbf{x}_n, \mathbf{x}_m) - 2C \sum_{n=1}^{N} [[|y_n - s_n| \ge \epsilon]] (|y_n - s_n| - \epsilon) \operatorname{sign}(y_n - s_n) K(\mathbf{x}_n, \mathbf{x}_m)$$
(30)

Problem 6

First, we have

$$e_{t} = \frac{1}{M} \sum_{m=1}^{M} (g_{t}(\tilde{\mathbf{x}}_{m}))^{2} - 2g_{t}(\tilde{\mathbf{x}}_{m})\tilde{y}_{m} + (\tilde{y}_{m})^{2}$$
(31)

And e_0 is

$$e_0 = \frac{1}{M} \sum_{m=1}^{M} (0)^2 - 2 \cdot 0 \cdot \tilde{y}_m + (\tilde{y}_m)^2 = \frac{1}{M} \sum_{m=1}^{M} (\tilde{y}_m)^2$$
 (32)

where we have used that $g_0(\mathbf{x}) = 0, \forall \mathbf{x}$.

So e_t can be rewritten as

$$e_{t} = e_{0} + \frac{1}{M} \sum_{m=1}^{M} (g_{t}(\tilde{\mathbf{x}}_{m}))^{2} - 2g_{t}(\tilde{\mathbf{x}}_{m}) \tilde{y}_{m} = e_{0} + s_{t} - \frac{2}{M} \sum_{m=1}^{M} g_{t}(\tilde{\mathbf{x}}_{m}) \tilde{y}_{m}$$
(33)

Hence,

$$\sum_{m=1}^{M} g_t(\tilde{\mathbf{x}}_m) \, \tilde{y}_m = \frac{M}{2} \left(e_0 + s_t - e_t \right) \tag{34}$$

Problem 7

Suppose the input is (a, b) with following cases.

1. $0 \le a \le b \le 1$.

Then the output should be (a^2, b^2) . The line equation of these two points (a, a^2) and (b, b^2) is

$$y = \frac{b^2 - a^2}{b - a} (x - a) + a^2 \tag{35}$$

Then $\bar{g}_1(x)$ should be

$$\int_{0}^{1} \int_{0}^{b} \left(\frac{b^{2} - a^{2}}{b - a} (x - a) + a^{2} \right) dadb = \int_{0}^{1} \left(\frac{1}{2} a^{2} (x - b) + abx \right) \Big|_{a=0}^{a=b} db$$
 (36)

$$= \int_0^1 \left(\frac{3}{2}b^2x - \frac{1}{2}b^3\right)db \tag{37}$$

$$= \left(\frac{1}{2}b^3x - \frac{1}{8}b^4\right)\Big|_{b=0}^{b=1} = \frac{1}{2}x - \frac{1}{8}$$
 (38)

2. $0 \le b < a \le 1$.

Similarly, we have

$$\bar{g}_2(x) = \frac{1}{2}x - \frac{1}{8}$$
 (39)

Hence, we have

$$\bar{g}(x) = \bar{g}_1(x) + \bar{g}_2(x) = x - \frac{1}{4}$$
 (40)

This makes sence since $\bar{g}(x)$ and f(x) should be the same at the average value of [0,1], which is

$$\bar{g}\left(\frac{1}{2}\right) = \frac{1}{2} - \frac{1}{4} = \frac{1}{4} = \left(\frac{1}{2}\right)^2 = f\left(\frac{1}{2}\right)$$
 (41)

Now we have

$$u_n \left(y_n - \mathbf{w}^T \mathbf{x}_n \right)^2 = u_n y_n^2 - 2u_n y_n \mathbf{w}^T \mathbf{x}_n + u_n \left(\mathbf{w}^T \mathbf{x}_n \right)^2$$
(42)

This is equal to

$$u_n \left(y_n - \mathbf{w}^T \mathbf{x}_n \right)^2 = \left(\sqrt{u_n} y_n \right)^2 - 2 \left(\sqrt{u_n} y_n \right) \left(\mathbf{w}^T \left(\sqrt{u_n} \mathbf{x}_n \right) \right) + \left(\mathbf{w}^T \left(\sqrt{u_n} \mathbf{x}_n \right) \right)^2$$
(43)

Hence, the pseudo data is $\{(\tilde{\mathbf{x}}_n, \tilde{y}_n)\}_{n=1}^N = \{(\sqrt{u_n}x_n, \sqrt{u_n}y_n)\}_{n=1}^N$.

Problem 9

With the rule of optimal re-weighting, we have

$$u_{+}^{(2)} = u^{(1)} \cdot 1\%, \ u_{-}^{(2)} = u^{(1)} \cdot 99\% \Rightarrow \frac{u_{+}^{(2)}}{u_{-}^{(2)}} = \frac{1}{99}$$
 (44)

Problem 10

Consider the following cases.

1. $1 < \theta \le 6$:

Since $s \in \{+1, -1\}$, d = 2 and R - L = 5 regions to put θ_i , so there are $2 \times 2 \times 5 = 20$ different decision stumps.

2. $\theta \le 1$ or $\theta > 6$:

Then there are only 2 decision stump: $g(\mathbf{x}) = +1$ with $(s = +1, \theta \le 1)$ or $(s = -1, \theta > 6)$; $g(\mathbf{x}) = -1$ with $(s = +1, \theta > 6)$ or $(s = -1, \theta \le 1)$ for all \mathbf{x} .

So there are

$$20 + 2 = 22 \tag{45}$$

different decision stumps.

Also, this can be generalized to

$$\underbrace{2}_{s \in \{+1,-1\}} \underbrace{d}_{\text{dimension}} \underbrace{(R-L)}_{\theta \text{ region}} + \underbrace{2}_{\text{left and right region}} = 2d(R-L) + 2 \tag{46}$$

First, we have

$$K_{ds}\left(\mathbf{x}, \mathbf{x}'\right) = \sum_{i=1}^{|\mathcal{G}|} \left(g_i\left(\mathbf{x}\right)\right)^T g_i\left(\mathbf{x}'\right)$$
(47)

$$= \sum_{i=1}^{|\mathcal{G}|} \left(s_i \operatorname{sign} \left(x_j - \theta_i \right) \right) \left(s_i \operatorname{sign} \left(x_j' - \theta_i \right) \right)$$
(48)

$$= \sum_{i=1}^{|\mathcal{G}|} \operatorname{sign}(x_j - \theta_i) \operatorname{sign}(x'_j - \theta_i)$$
(49)

where $(s_i)^2 = 1$ since $s_i \in \{+1, -1\}$.

Now if $x_j = x'_j$, applying the general result of Problem 11, we have

$$K_{ds}\left(\mathbf{x},\mathbf{x}'\right) = 2d\left(R - L\right) + 2\tag{50}$$

since all g_i are the same.

If $x_j \neq x'_j$, there are $(x_j - x'_j)$ different output by decision stump g_i in j^{th} dimension with some fixed s_i . One different output causes the result from +1 to -1, so the summation minus by 2 with each different output. Hence

$$K_{ds}\left(\mathbf{x}, \mathbf{x}'\right) = 2d\left(R - L\right) + \underbrace{\left(-2\right)}_{\text{from } + 1 \text{ to } -1} \times \underbrace{2}_{s \in \{+1, -1\}} \times \left\|\mathbf{x} - \mathbf{x}'\right\|_{1} + 2$$

$$(51)$$

$$=2d\left(R-L\right)-4\left|\mathbf{x}-\mathbf{x}'\right|_{1}+2\tag{52}$$

where $|\mathbf{x} - \mathbf{x}'|_1$ denotes the one-norm of $(\mathbf{x} - \mathbf{x}')$.

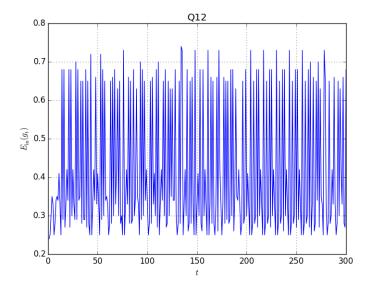

Figure 1: Q12

 $E_{\rm in} = 0.24, \ \alpha_1 = 0.576339754969.$

Problem 13

The result oscillates. Since re-weighting causes g_{t+1} and g_t to be very different in each iteration. So it oscillates.

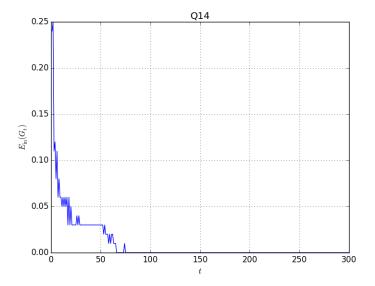

Figure 2: Q14

 $E_{\rm in}\left(G\right)=0.0.$

Problem 15

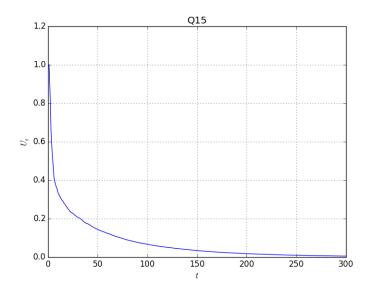

Figure 3: Q15

$$U_2 = 0.8542, U_T = 0.0055.$$

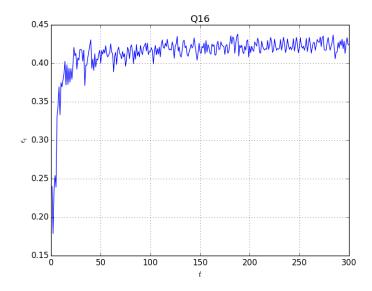

Figure 4: Q16

 $\min\left(\epsilon_t\right) = 0.17873.$

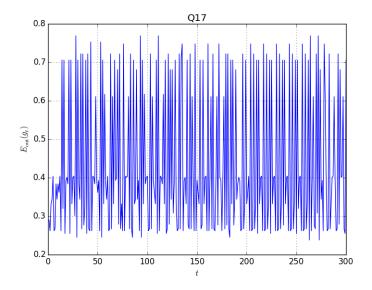

Figure 5: Q17

$$E_{\text{out}}(g_1) = 0.29.$$

Problem 18

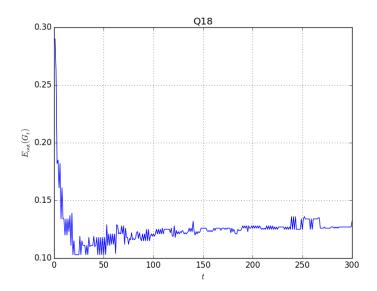

Figure 6: Q18

$$E_{\text{out}}(G) = 0.132.$$

Minimum $E_{\text{in}}(g)$ is 0.0, with $\lambda = 0.001$, $\gamma = 32$.

Problem 20

Minimum $E_{\text{out}}(g)$ is 0.39, with $\lambda = 1000$, $\gamma = 0.125$.

Problem 21

First, we have

$$U_{1} = \frac{1}{N} \sum_{n=1}^{N} \exp\left(-y_{n} \sum_{\tau=1}^{0} \alpha_{\tau} g_{\tau}\left(\mathbf{x}_{n}\right)\right) = \frac{1}{N} \sum_{n=1}^{N} \exp\left(0\right) = \frac{1}{N} \times N = 1$$
 (53)

Then, we have

$$U_{t+1} = \frac{1}{N} \sum_{n=1}^{N} \exp\left(-y_n \sum_{\tau=1}^{t} \alpha_{\tau} g_{\tau} \left(\mathbf{x}_n\right)\right)$$
(54)

$$= \frac{1}{N} \sum_{n=1}^{N} \exp \left(-y_n \sum_{\tau=1}^{t-1} \alpha_{\tau} g_{\tau} \left(\mathbf{x}_n\right) - y_n \alpha_t g_t \left(\mathbf{x}_n\right)\right)$$
(55)

$$= \frac{1}{N} \sum_{n=1}^{N} \exp \left(-y_n \sum_{\tau=1}^{t-1} \alpha_{\tau} g_{\tau} \left(\mathbf{x}_n\right)\right) \exp \left(-y_n \alpha_t g_t \left(\mathbf{x}_n\right)\right)$$
(56)

$$= \sum_{n=1}^{N} u_n^{(t)} \exp\left(-y_n \alpha_t g_t\left(\mathbf{x}_n\right)\right)$$
 (57)

$$= \sum_{\substack{n \ y_n \neq g_t(\mathbf{x}_n)}} u_n^{(t)} \exp\left(-y_n \alpha_t g_t\left(\mathbf{x}_n\right)\right) + \sum_{\substack{n \ y_n = g_t(\mathbf{x}_n)}} u_n^{(t)} \exp\left(-y_n \alpha_t g_t\left(\mathbf{x}_n\right)\right)$$
 (58)

$$= \sum_{\substack{n \ y_n \neq g_t(\mathbf{x}_n)}} u_n^{(t)} \exp\left(\alpha_t\right) + \sum_{\substack{n \ y_n = g_t(\mathbf{x}_n)}} u_n^{(t)} \exp\left(-\alpha_t\right)$$
(59)

$$= \exp\left(\alpha_t\right) \left(\epsilon_t\right) \sum_{n=1}^{N} u_n^{(t)} + \exp\left(-\alpha_t\right) \left(1 - \epsilon_t\right) \sum_{n=1}^{N} u_n^{(t)}$$

$$\tag{60}$$

$$= U_t \left(\exp \left(\alpha_t \right) \left(\epsilon_t \right) + \exp \left(-\alpha_t \right) \left(1 - \epsilon_t \right) \right) = U_t \cdot 2\sqrt{\epsilon_t \left(1 - \epsilon_t \right)}$$
 (61)

Since $\epsilon_t \leq \epsilon < 1/2$, we have

$$\epsilon_t (1 - \epsilon_t) \le \epsilon (1 - \epsilon) \Rightarrow U_t \cdot 2\sqrt{\epsilon_t (1 - \epsilon_t)} \le U_t \cdot 2\sqrt{\epsilon (1 - \epsilon)}$$
 (62)

Problem 22

From the result of Problem 21, we have

$$U_{t+1} = U_t \cdot 2\sqrt{\epsilon_t (1 - \epsilon_t)} \le U_t \cdot 2\sqrt{\epsilon (1 - \epsilon)} \le U_t \exp\left(-2\left(\frac{1}{2} - \epsilon\right)^2\right), \ \epsilon < \frac{1}{2}$$
 (63)

At t = T, we have

$$0 \le E_{\text{in}}(G_T) \le U_{T+1} \le U_T \exp\left(-2\left(\frac{1}{2} - \epsilon\right)^2\right) \tag{64}$$

And this can be rewritten as

$$0 \le E_{\text{in}}(G_T) \le U_T \exp\left(-2\left(\frac{1}{2} - \epsilon\right)^2\right) \le U_{T-1} \exp\left(-4\left(\frac{1}{2} - \epsilon\right)^2\right)$$
 (65)

$$\leq \cdots \leq U_1 \exp\left(-2T\left(\frac{1}{2} - \epsilon\right)^2\right) = \exp\left(-2T\left(\frac{1}{2} - \epsilon\right)^2\right)$$
 (66)

Let $O(T) = O(\ln N)$, say that $T = \ell \ln N + k$, where ℓ , $k \in \mathbb{R}$ and $\ell > 0$. Then we have

$$0 \le E_{\rm in}(G_T) \le \exp\left(-2\ell \ln N \left(\frac{1}{2} - \epsilon\right)^2 - 2k \left(\frac{1}{2} - \epsilon\right)^2\right) \tag{67}$$

Suppose ℓ is large enough that

$$-2\ell \ln N \left(\frac{1}{2} - \epsilon\right)^2 - 2k \left(\frac{1}{2} - \epsilon\right)^2 \approx -2\ell \ln N \tag{68}$$

So

$$0 \le E_{\text{in}}(G_T) \le \exp(-2\ell \ln N) = \frac{1}{N^{2\ell}}$$
 (69)

As ℓ lerge enough, we have $1/N^{2\ell} \approx 0 \Rightarrow E_{\rm in}(G_T) = 0$.
